

Frequently Asked Questions

DEI Heat Shroud™

How do I install Heat Shroud?

Covering wires, lines, or hoses with Heat Shroud is simple. Measure the length needed and by using a razor or scissors cut the material. Then wrap the Heat Shroud around the area where protection is needed and close the hook and loop material.

What size and temperature can this handle?

Our heat shroud will close to one half inch and expand to one and a quarter inches. The length of the Heat Shroud is three feet, or thirty six inches. The material is fire proof and will handle five hundred degrees F direct continuous. Also the material will withstand two thousand degrees F radiant heat.

What about angles or bends?

Heat Shroud will accept bends with no problem. The material is flexible and will stay together to protect on an angle due to our closure design.
